WORK EXPERIENCE

Software Engineer Mar 2026 – Present

Copper Digital, Remote | AI automation for US home-health care providers

- Designed the **nightly sync** that keeps patient records current from clients' records system (EMR, no API) on top of **AWS** (Lambda, SQS, Playwright on ECS); reading only changes cut **4 min to 1 min** per patient: **925 patients, 8 clients, 2 h**.
- Built a **billing-readiness system** that checks each Medicare claim before it is sent (signed visits, doctor's orders, consents), using **AI to read documents** and routing gaps to the right person; **replaced a manual audit** at a 700-patient client.
- Built **end-to-end automation for OASIS-E2**, the Medicare-required patient assessment: AI drafts discharge and transfer forms from visit notes, then the system writes them into the EMR and verifies the save; **transfers now run with no manual step**.
- Built **AI document intelligence** on AWS Bedrock that turns referral and hospital papers into facts, each linked to its source page; patients with a recorded hospital history rose from **95 to 268**, for ∼$35 across **3,315 documents**.
- Wrote the **platform design doc** that merged separate products into **one backend with 5 sellable modules** and role-based access, cutting **13 services to 7**, plus design docs on FHIR integration and build vs buy for browser automation.
- Ran requirement meetings with clients and the founder, turned them into **design docs** (billing rules, discharge form autofill, workflow automation), then **built and shipped each one to production**, where all are now **in active use by clients**.
- Stopped **duplicate patient records** arriving from 5 sources (fax, referral portals, EMR, uploads) with one shared matching system; merged **31 existing duplicates** safely and ended a loop that re-processed **∼4,800 notes a month**.
- Fixed a **database locking issue** causing **∼300 failed updates a day** by giving each patient its own lock and ordering writes, and made every data fix go through a **dry run and a replay on real data** before release.

Software Engineer (Software Engineering Intern, Jan – Jul 2025) Jan 2025 – Feb 2026

NativeBridge, Bangalore | cloud platform where app developers test on real Android phones remotely

- Built the **network layer** that lets developers control remote phones: a **Python TCP proxy** routing Android debug (ADB) traffic, with **Redis**-backed session state and per-session access control, serving **100+ concurrent device sessions**.
- Built the **device-allocation backend** with **FastAPI and SQS**, queuing session requests and keeping a pool of warm devices ready; cut p99 session start time **40%** and stayed stable through the **Product Hunt launch** traffic spike.
- Built **subscription billing on Paddle** (3 plans, prorated credits, retries for failed payments, duplicate-safe payment webhooks), keeping every account's billing state correct through plan changes and payment failures.
- Built an **Android Enterprise device-management app (DPC)** using DevicePolicyManager and Firebase Cloud Messaging, giving the platform central control of every phone: remote commands and persistent admin access.
- Built **access control for app assets** and integrated **Slack, Jira and GitHub via OAuth 2.0**.
- Built a **log pipeline** streaming device and session logs to Betterstack for live debugging and AWS Glacier for long-term archival, with structured parsing and tracing that cut **incident resolution time 60%**.
- Migrated **terabytes** of production data from Google Cloud Storage to **AWS S3** with **zero downtime**, moving data, access policies and live service traffic without interrupting users.

PROJECTS

Shiplog – AI Release Notes Platform | Live Demo | Source Code Aug 2026 – Sep 2026

- Turns merged GitHub pull requests into **customer-facing release notes**. Split the AI step into classify and draft stages so internal changes are filtered by code, raising feature coverage from **89% to 100%** on an 18-PR test set.
- Built GitHub webhook ingestion that **never duplicates data** when GitHub resends events (signature checks, delivery-ID dedup, upserts), and cut onboarding database calls **76%** by batching writes.

SKILLS

Languages: Python, SQL, C++

Backend: FastAPI, SQLAlchemy, Node.js, REST APIs, Event-Driven Systems, Message Queues, Playwright

Databases: PostgreSQL, MongoDB, Redis, MySQL

AI Engineering: AI Agents & Tool Use, Eval Harnesses, Prompt Caching, Guardrails, Human-in-the-Loop, Bedrock, Claude Code

Cloud & DevOps: AWS (ECS Fargate, Lambda, SQS, EventBridge, S3, RDS, Textract), Docker, Linux, GitHub Actions, CI/CD

System Design: High-Level Design (HLD), Low-Level Design (LLD) **Frontend:** React, TypeScript

Core CS: Data Structures & Algorithms, Operating Systems, Database Management Systems, Computer Networks

EDUCATION

National Institute of Technology, Jamshedpur Jamshedpur, India

Bachelor of Technology | CGPA: 8.24 *2021–2025*

ACHIEVEMENTS

- Core engineer in a **4-person team** that took NativeBridge to **$80k ARR**, **2,000+ weekly active users** across **110+ countries**, and **Product Hunt Product of the Day**.
- Qualified for the **Indian National Mathematics Olympiad** (INMO training camp, IIT Madras); **1st place**, GeeksforGeeks Hackathon (Google Cloud and AMD).
